# 1 Areas of application

RICKMEIER gear pumps are used primarily in oil hydraulics, lubrication technology and for the transport of various oils or lubricating substances.

## Typical areas of application

General machine construction	Automobile manufacturing	Apparatus construction
Construction machines	Mining technology	
Chemical plant construction		
Diesel motors	Printing machines	
Electric motor construction		
Vehicle technology		
Gas turbines	Gearing	Foundry technology
Woodworking technology		
Industrial gear manufacturing		
Refrigeration technology	Compressor construction	Power plant construction
Engine and motor construction		
Paper machines	Pump construction	
Ship construction		
Textile machines		
Compressor construction		
Water turbines	Rolling mill industry	Machine tools
Wind power generation		
Cement factory construction		

## Typical flow media

Waste oil	ATF oil
Drilling oil	
Diesel fuels	
Emulsions	
Gear oil	
Heating oils	Hydraulic oil
Motor oil	
Polyglycol oil	Polyalphaolefin oil
Cutting oil	Heavy oil
Heat transfer oil	
Drawing oil	Other flow media on request

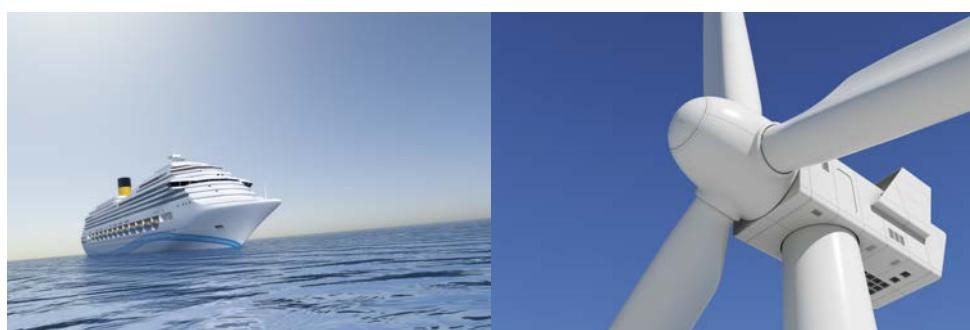

Fig. 1: Application examples

## 2 Description

### 2.1 Design

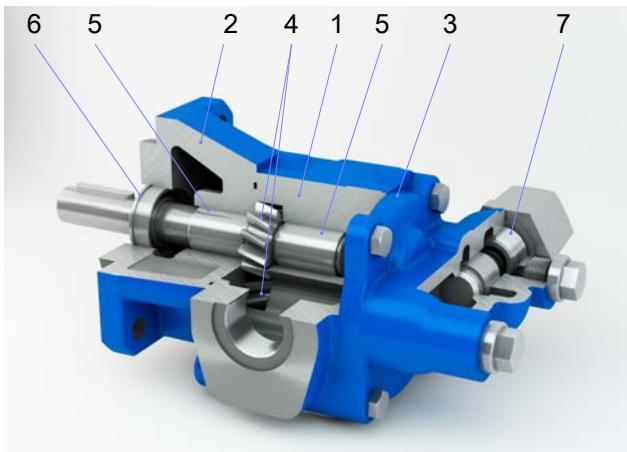

Fig. 2: Gear pump - standard design

1 Gear casing	2 Driving cover
3 End cover	4 Hardened gear shafts
5 Multicomponent friction bearing	6 Radial shaft seal
7 Option: pressure relief valve	

### 2.2 Product description

RICKMEIER gear pumps are characterised by a simple and robust structure. Short, straight flow channels ensure good priming characteristics and quiet running. Together with a special design of the toothing and the gear casing, an extremely low noise level is ensured during operation.

The casings of the standard version are made of grey cast iron, the gear parts of hardened steel. Generously dimensioned, specially coated multicomponent friction bearings have a long service life and very good dry-running properties.

The shaft seal is designed as standard with a radial shaft seal. In addition, numerous sealing variants are possible (such as a mechanical seal).

### 3 Functioning principle

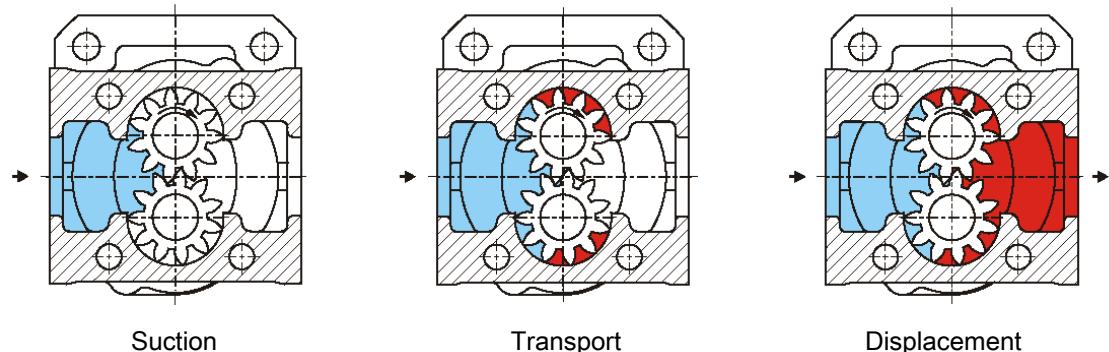

Fig. 3: Gear pump delivery principle

Gear pumps are rotary displacement pumps. When the gear shafts turn, the medium enclosed in the space between the teeth is transported from the suction to the pressure side. Then the medium is displaced toward the pressure side by the intermeshing teeth. The transport of the flow medium results in a pressure drop on the suction side of the gear pump. The flow medium compensates for this pressure drop by flowing in, thereby maintaining the feed process.

This process is the same for both gaseous and liquid media. As a result, the gear pump is capable of priming the suction pipe itself until it is completely filled with liquid flow medium.

#### Note

The venting of the suction line is not possible under the following conditions:

- The suction line is leaking which means that a vacuum cannot develop.
- The pressure in the suction-side pipeline system and/or tank is too low to allow a subsequent flow of the pumped medium. This is possible if a vacuum is present or if the liquid level is too far below the gear pump.
- On the pressure side of the gear pump, a non-return valve is installed (provide a bleeder valve).

#### Pressure relief valve

The pressure relief valve integrated in the end cover of the gear pump as an option is designed as a spring-loaded valve. It may only be used as an occasionally actuated valve for pressure relief.

#### Note

If a larger partial volume of the flow medium must be drained off over an extended period, a separate valve with a return pipe to the suction tank in the pipe (e.g. Rickmeier valves of type RSn, DBV40 or DB9) must be provided.

Fig. 4: Pressure relief valve for pipe installation (example: DB9)

## 4 Direction of rotation and delivery

### 4.1 Determining the direction of rotation

Unless otherwise stated, the gear pump rotation is "clockwise" when looking at the face of the driving gear shaft (see the following figure).

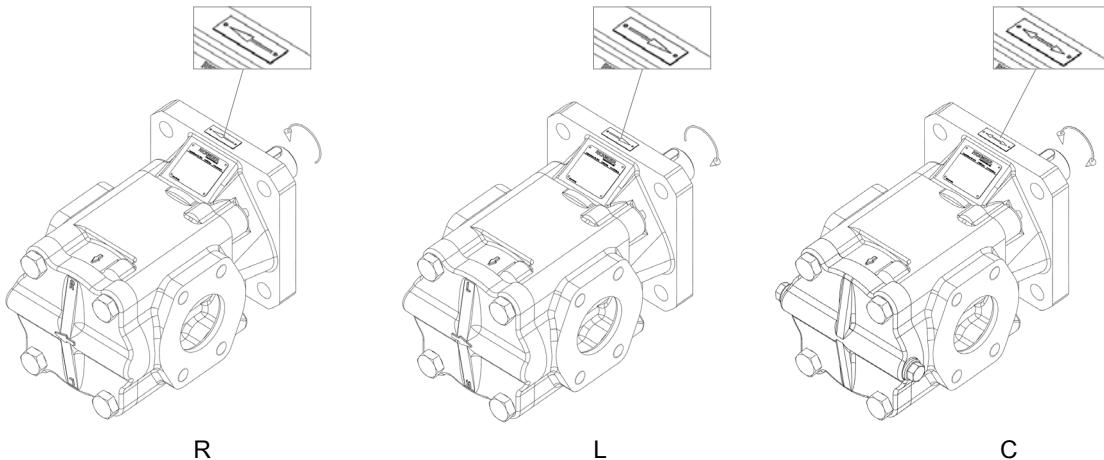

Fig. 5: Direction of rotation and delivery

(Direction of rotation R: clockwise; direction of rotation L: anti-clockwise; direction of rotation C: clockwise and anti-clockwise)

#### Note

When the optional C version is equipped, the gear pumps can be operated in both clockwise and anti-clockwise rotation (with changing direction of delivery). This version is only possible in the case of gear pumps without a pressure relief valve.

### 4.2 Changing the direction of rotation and conveyance

Depending on the design and size, it is possible to convert the gear pumps locally to the other direction of rotation (with a changed direction of delivery). Please contact our [customer service](#) (giving the data on the name plate).

## 5 Guidelines and acceptance

RICKMEIER is certified according to EN ISO 9001 and EN ISO 14001.

In addition, RICKMEIER implements the specifications in accordance with the REACH Regulation 1907/2006/EC.

RICKMEIER gear pumps can be supplied in accordance with the ATEX Directive 2014/34/EU. Since the approval depends on the application and design of the gear pump, please contact Sales.

Upon request, all products can be supplied with factory certificate EN 10204-2.2 or acceptance test certificate EN 10204-3.1.

The purchase of gear pumps through classification societies is also possible at our company (e.g., through Lloyd's Register, Bureau Veritas, DNV GL and many others).

## 6 Standard design and variants

The variable modular system of RICKMEIER gear pumps makes it possible to implement a wide variety of material, casing, sealing and functional variants.

In addition to a standard version, the gear pumps can be adapted to the respective application due to the diverse and variable possibilities.

### 6.1 Materials

	<b>Standard</b>	<b>Alternative</b>
Casing	– EN-GJL-250 (GG-25)	– EN-GJS-400-15 (GGG-40)
Gear wheel shafts	– Case-hardened steel (16MnCrS5)	
Radial shaft seals	– NBR – FKM	– HNBR – PTFE – EPDM – <i>Additional upon request</i>
Mechanical seals	– Hard carbon/SiC	– Various material combinations upon request
O-rings	– NBR – FKM	– HNBR – PTFE – EPDM – <i>Additional upon request</i>
Friction bearing	– Composite bearing type P10/DU	– Friction bearings free of ferrous and non-ferrous metals – <i>Additional upon request</i>
Corrosion protection	– 2-component paint	– Various coating materials and structures available upon request, for example: C4

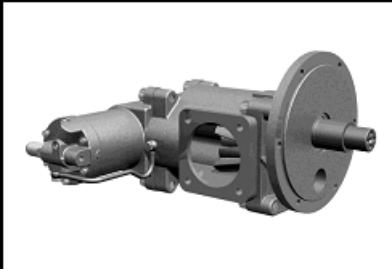

Tab. 1: Materials

## 6.2 Mounting flange

In the standard version, the gear pumps have a square mounting flange.

On request, the standard mounting flanges can be provided with a bolt-on angled pump foot ("FU" design).

*Alternatively, it is possible to design the mounting flange as a custom solution in any shape, such as round or oval.*

Standard	Alternative (customer-specific solutions in any form)
Square	Oval
	
Example: R25	Example: R25
Additional bolt-on angled pump foot ("FU" design)	Round
	
Example: R35	Example: R35
	
	Example: R65
	
	Example: R95

Tab. 2: Mounting flange design variants

## 6.3 Connections

Depending on the size, the pipe connections are designed as follows:

R25	Threaded hole with inch thread or metric SAE flange pattern according to ISO 6162
R35 through R65	Metric SAE flange pattern according to ISO 6162
R95	Flange pattern according to Rickmeier standard
R105	Flange pattern according to EN 1092-1

*Depending on customer requirements, alternatively special gear casings with any connection diagram can be supplied, such as axial pipe connections, plug-in pipe connections or flange patterns according to SOLAS (in combination with standard pump components).*

Standard	Alternative (customer-specific solutions in any form) or flange patterns according to SOLAS
Threaded hole with inch thread	Axial
	
Example: R25	Example: R25
Metric SAE flange pattern according to ISO 6162	<i>Flange pattern offset to middle of axis</i>
	
Example: R25	Example: R65
Flange pattern according to Rickmeier standard (Size R95)	Double pump (duplex pump) in sizes R25 to R65
	
Example: R95	Example: R35
Flange pattern according to EN 1092-1 (Size R105 – upon request)	

Tab. 3: Pipe connection design variants

## 6.4 Shaft end

In the standard design, the gear pumps have a cylindrical shaft end and fitted key.

*The shaft version with tapered seat 1:10 is available in many sizes (e.g., for the positive connection of a pinion). In addition, shaft ends of different designs are possible, for example, cylindrical without fitted key or cylindrical with internal thread, with splined shaft DIN 5480 or with tappet (Oldham coupling).*

Standard	Alternative
Cylindrical, with fitted key	Conical seat 1:10
	
Example: R25	Example: R25
	Toothed shaft profile according to DIN 5480
	
	Example: R35
	Tappet (Oldham coupling)
	
	Example: R35

Tab. 4: Shaft end design variants

## 6.5 Shaft seal

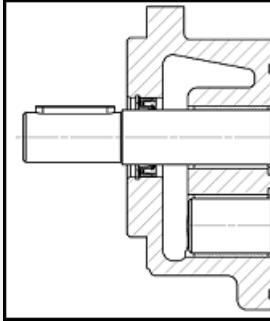

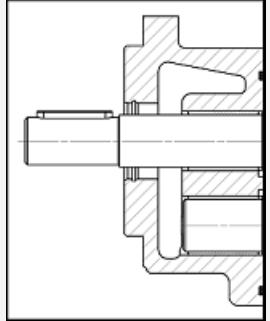

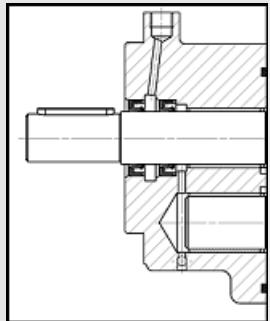

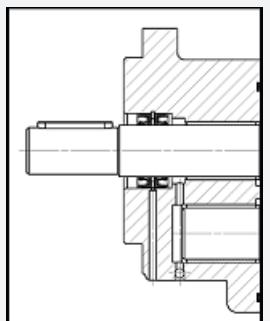

### 6.5.1 Radial shaft seal (RWDR)

For many use cases, the standard built-in radial shaft seal is the best economical and technical solution. It is a wear-optimized design that ensures a long service life.

*In addition, the following seal variants are available for special requirements in various material combinations (see Table 5):*

- Without radial shaft seal (direct attachment of the gear pump to the gearing or motor casing)
- Single radial shaft seal with increased inlet pressure at the pump inlet (up to 6 bar)
- Double radial shaft seal with connection hole for liquid reservoir
- Double radial shaft seal for vacuum operation with connection hole for liquid reservoir
- Double radial shaft seal for media separation (with leakage control hole)

A screw-in oil reservoir for liquid feed can be supplied on request.

Standard	Alternative
Simple radial shaft seal	Without radial shaft seal
	
	Double radial shaft seal with connection hole for liquid reservoir
	
	Double radial shaft seal for media separation (with leakage control hole)
	

Tab. 5: Sealing with radial shaft seal design variant

### 6.5.2 Mechanical seal (GLRD)

All gear pumps can be equipped as a special design with mechanical seals. The suitable design and material combination will be selected according to application and flow medium.

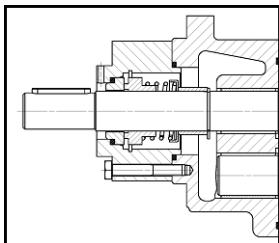

Fig. 6: Mechanical seal

### 6.5.3 Magnetic coupling (MK)

If absolute freedom from leakage is required, the gear pumps and pump units can be hermetically sealed by equipping them with a magnetic coupling. This variant is ideal, for example, when pumping critical media, for vacuum operation or in systems with a high inlet pressure.

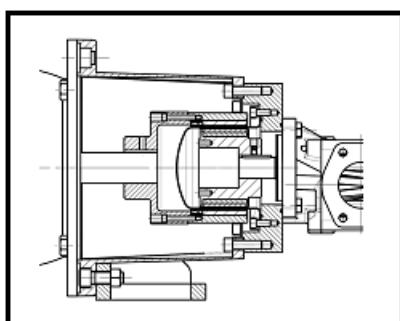

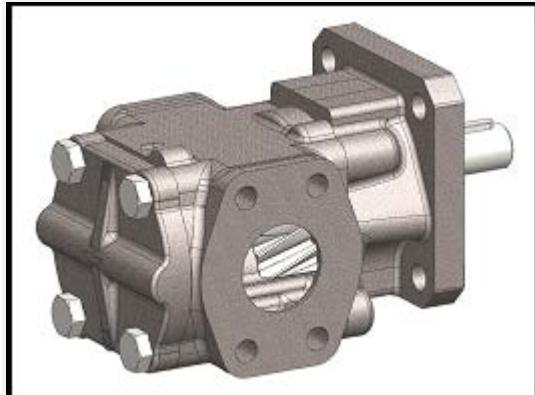

Fig. 7: Magnetic coupling

## 6.6 Pressure relief valve (DB)

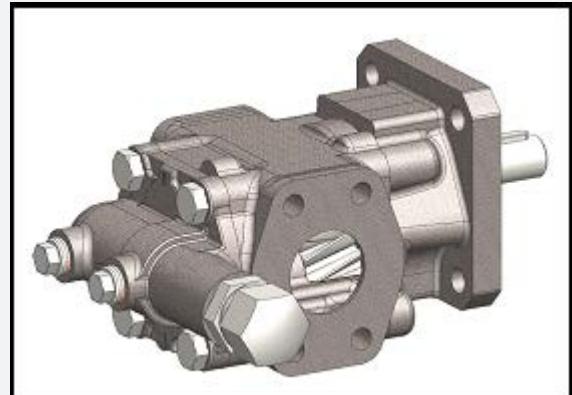

All gear pumps of the R5 series can alternatively be supplied with or without pressure relief valve (DB).

Without DB

Example: R35

With DB

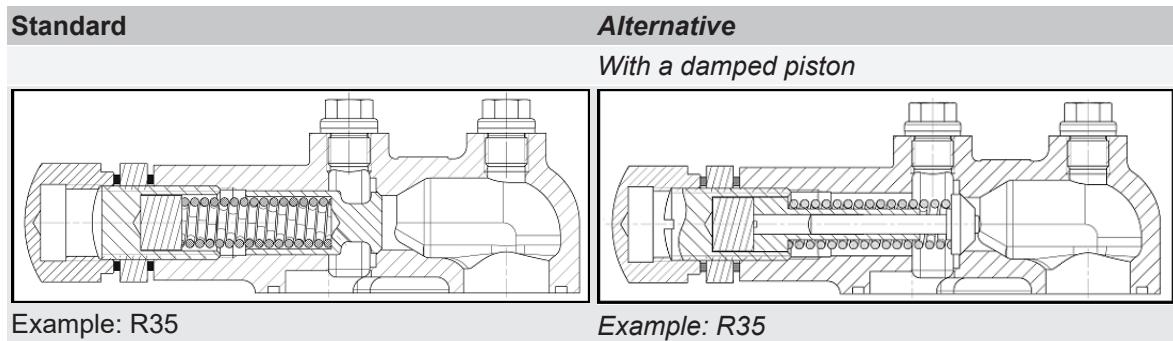

Example: R35

Tab. 6: Design variants for gear pump with or without pressure relief valve

The pressure relief valve integrated into the end cover of the gear pump is a spring-loaded valve. Since the discarded oil circulates internally, it may only be used as an occasionally actuated valve for pressure relief.

We can offer the following variants for the design of the pressure relief valve:

- With a damped piston
- In heat-resistant design for operating temperatures > 120°C
- As a pressure control valve with external actuation

Tab. 7: Pressure relief valve (DB) design variants

## 6.7 Noise optimisation

In applications with flow media with increased air content, a significant noise pollution by the gear pump is often determined. Pump casings of all sizes can be optionally equipped with an internal additional machining, which in this case causes a significant reduction of the sound pressure level.

Depending on operating data and air content, sound pressure level reductions up to 15 dB(A) are possible. The delivery performance and efficiency of the gear pump are not adversely affected by this, but no noise reduction is to be expected due to this modification in the case of flow medium that do not contain air.

## 7 Designation and configuration

### 7.1 Type key

The designation of the RICKMEIER gear pumps is made according to the following key:

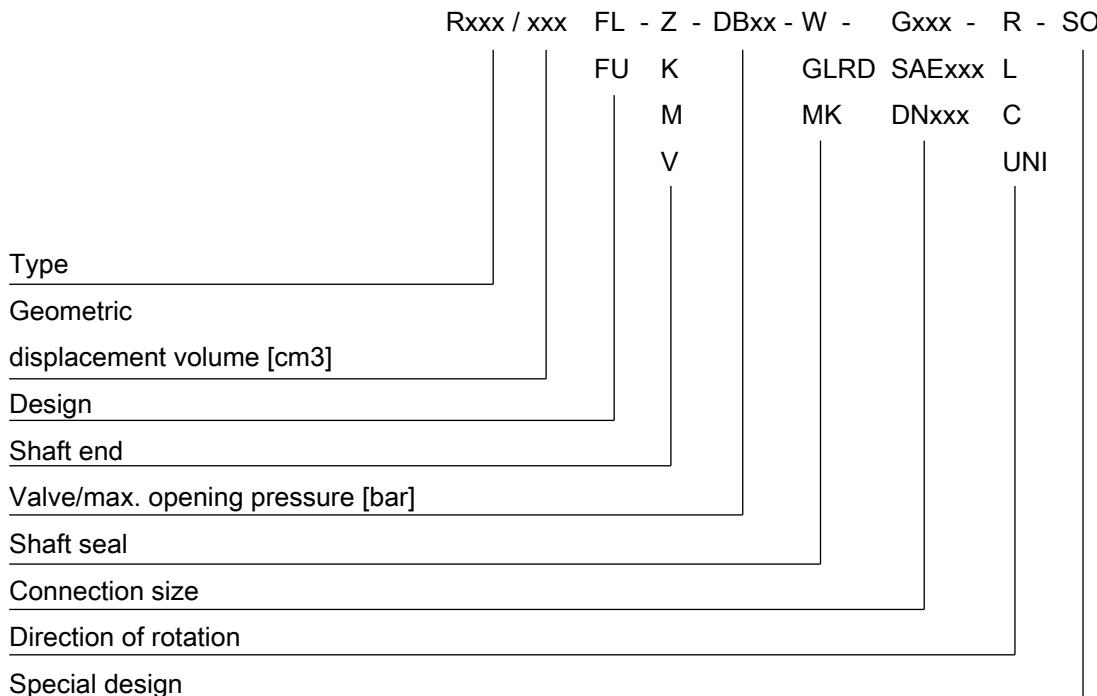

Fig. 8: Type key

### 7.2 Pump selection

The following selection tables allow you to configure the desired pump design by ticking options. The completed sheets can be sent to us together with your request.

For many applications, the **bolded** standard versions are sufficient. For further information on the *italicised* options and special designs, please contact us.

The gear pumps can naturally also be designed with our support. In that case, please contact us; please use the table in the following chapter "Pump design."

### 7.2.1 Size (type)/geometric displacement volume Vg

<input type="checkbox"/> R25	<input type="checkbox"/> 2.5	<input type="checkbox"/> 3.15	<input type="checkbox"/> 4	<input type="checkbox"/> 5	<input type="checkbox"/> 6.3
	<input type="checkbox"/> 8	<input type="checkbox"/> 10	<input type="checkbox"/> 12.5	<input type="checkbox"/> 16	<input type="checkbox"/> 20
<input type="checkbox"/> R35	<input type="checkbox"/> 25	<input type="checkbox"/> 31.5	<input type="checkbox"/> 40		
	<input type="checkbox"/> 50	<input type="checkbox"/> 63	<input type="checkbox"/> 80		
<input type="checkbox"/> R45	<input type="checkbox"/> 80	<input type="checkbox"/> 100	<input type="checkbox"/> 112	<input type="checkbox"/> 125	
	<input type="checkbox"/> 160	<input type="checkbox"/> 180	<input type="checkbox"/> 200		
<input type="checkbox"/> R65	<input type="checkbox"/> 200	<input type="checkbox"/> 250	<input type="checkbox"/> 315		
	<input type="checkbox"/> 400	<input type="checkbox"/> 500	<input type="checkbox"/> 630		
<input type="checkbox"/> R95	<input type="checkbox"/> 710	<input type="checkbox"/> 800	<input type="checkbox"/> 900	<input type="checkbox"/> 1000	
	<input type="checkbox"/> 1120	<input type="checkbox"/> 1250	<input type="checkbox"/> 1400	<input type="checkbox"/> 1600	<input type="checkbox"/> 1800
<input type="checkbox"/> R105	<input type="checkbox"/> 1800	<input type="checkbox"/> 2000	<input type="checkbox"/> 2200	<input type="checkbox"/> 2400	<input type="checkbox"/> 2600

→ Please select a displacement volume V<sub>g</sub> [cm<sup>3</sup>] and the corresponding size!

### 7.2.2 Design

<input type="checkbox"/> FL	<b>Square mounting flange</b>
<input type="checkbox"/> FU	<i>With bolted-on foot</i>
<input type="checkbox"/> OTHER	<i>E.g., round, oval</i>

→ Please select a design! For designs other than "FL", please contact us.

### 7.2.3 Shaft end

<input type="checkbox"/> Z	<b>Cylindrical shaft end with fitted key</b>
<input type="checkbox"/> K	<i>Tapered shaft end</i>
<input type="checkbox"/> M	<i>Tappet</i>
<input type="checkbox"/> V	<i>Gearing</i>
<input type="checkbox"/> OTHER	<i>E.g., cylindrical shaft end with fitted key</i>

→ Please select a shaft end! If the shaft end differs from "Z", please contact us.

#### 7.2.4 Pressure relief valve

<input type="checkbox"/> Without DB	Without pressure relief valve
<input type="checkbox"/> With DB	With pressure relief valve
	<input type="checkbox"/> <i>Optional: damped design</i>
	<input type="checkbox"/> <i>Optional: heat-resistant design (for media temperatures &gt; 120°C)</i>
	<input type="checkbox"/> <i>Optional: pilot-operated version (possible with size R65/R95/R105)</i>

→ Please select whether the gear pump should be equipped with or without an integrated pressure relief valve (DB)! If "With DB" is selected, please select optional versions (if desired).

#### 7.2.5 Pressure relief valve - pressure range/presetting

R25	<input type="checkbox"/> DB4 (1...4 bar)	<input type="checkbox"/> DB16 (4...16 bar)	<input type="checkbox"/> DB25 (16...25 bar)
R35	<input type="checkbox"/> DB6 (1...6 bar)	<input type="checkbox"/> DB16 (6...16 bar)	<input type="checkbox"/> DB25 (16...25 bar)
R45	<input type="checkbox"/> DB4 (1...4 bar)	<input type="checkbox"/> DB16 (4...16 bar)	<input type="checkbox"/> DB25 (16...25 bar)
R65	<input type="checkbox"/> DB4 (1...4 bar)	<input type="checkbox"/> DB16 (4...16 bar)	<input type="checkbox"/> DB25 (16...25 bar)
R95	<input type="checkbox"/> DB7 (1...7 bar)	<input type="checkbox"/> DB12 (7...12 bar)	
R105	<input type="checkbox"/> DB7 (1...7 bar)	<input type="checkbox"/> DB12 (7...12 bar)	

Presetting for opening pressure: bar

→ For the version "With DB" please select a pressure range for the preselected size!

→ Please enter the desired presetting for the opening pressure; otherwise the opening pressure is preset to the maximum pressure.

#### 7.2.6 Shaft seal

<input type="checkbox"/> Without	Without
<input type="checkbox"/> W	<input type="checkbox"/> <b>Simple radial shaft seal (RWDR), wear-optimised</b> <input type="checkbox"/> Variant: single radial shaft seal with increased inlet pressure at the pump inlet (up to 6 bar) <input type="checkbox"/> Variant: double radial shaft seal with connection hole for liquid reservoir <input type="checkbox"/> Variant: double radial shaft seal for vacuum operation with connection hole for liquid reservoir <input type="checkbox"/> Variant: double radial shaft seal for media separation (with leakage control hole)
<input type="checkbox"/> GLRD	<input type="checkbox"/> <b>Mechanical seal with inlet pressure at the pump inlet up to 10 bar</b> <input type="checkbox"/> Variant: mechanical seal for inlet pressure at pump inlet > 10 bar
<input type="checkbox"/> MK	<input type="checkbox"/> <b>Magnetic coupling with stainless steel containment shell, inlet pressure up to 16 bar</b> <input type="checkbox"/> Alternatively: other containment shell materials and higher inlet pressures available on request

→ Please select a shaft seal! When selecting "W," "GLRD" or "MK," please choose desired version.

#### 7.2.7 Connection/connection size

R25	2.5...10	<input type="checkbox"/> G 3/4	<input type="checkbox"/> SAE 3/4	Nominal diameter 20
	12.5...20	<input type="checkbox"/> G 1	<input type="checkbox"/> SAE 1	Nominal diameter 25
R35	25...40	SAE 1.1/2		Nominal diameter 40
	50...80	SAE 2		Nominal diameter 50
R45	80...112	SAE 2		Nominal diameter 50
	125...200	SAE 2.1/2		Nominal diameter 65
R65	200...315	SAE 3		Nominal diameter 80
	400...630	SAE 4		Nominal diameter 100
R95	710...1120	<input type="checkbox"/> F132 (Rickmeier standard)	Nominal diameter 132	
		<input type="checkbox"/> DIN EN 1092-1 (DN 160)	Nominal diameter 160	
	1250...1800	<input type="checkbox"/> F160 (Rickmeier standard)	Nominal diameter 160	
		<input type="checkbox"/> DIN EN 1092-1 (DN 160)	Nominal diameter 160	
R105	1800...2600	DIN EN 1092-1 (DN 200)		Nominal diameter 200

→ Please select a connection type for size R25 and R95!

→ If other connection types or sizes are desired, please contact us.

#### 7.2.8 Direction of rotation (facing the shaft end)

<input type="checkbox"/> R	Clockwise
<input type="checkbox"/> L	Anti-clockwise
<input type="checkbox"/> C	Clockwise/anti-clockwise rotation with changing direction of delivery
<input type="checkbox"/> UNI	Clockwise/anti-clockwise rotation with consistent direction of delivery (Size R35/R45/R65)

→ Please select a direction of rotation version! With "UNI", the use of a reversing valve is required.

#### 7.2.9 Materials

Casing	<input type="checkbox"/> EN-GJL-250 (GG-25)
	<input type="checkbox"/> Alternative: EN-GJS-400-15 (GGG-40)
Radial shaft seals	<input type="checkbox"/> NBR
	<input type="checkbox"/> FKM
	<input type="checkbox"/> Alternative: HNBR, PTFE, EPDM, additional upon request
Mechanical seal	<input type="checkbox"/> Hard carbon/SiC
	<input type="checkbox"/> Alternative: various material combinations upon request
O-rings	<input type="checkbox"/> NBR
	<input type="checkbox"/> FKM
	<input type="checkbox"/> Alternative: HNBR, PTFE, EPDM, additional upon request

Friction bearing	<input type="checkbox"/> <b>Composite bearing type P10/DU</b>
	<input type="checkbox"/> Alternative: <i>friction bearings free of ferrous and non-ferrous metals, additional upon request</i>
Coating	<input type="checkbox"/> <b>2-component paint</b>
	<input type="checkbox"/> <i>Alternatively: other colours, coating materials and structures available on request</i>

→ Please select materials for housing, preselected shaft seal, O-rings, friction bearing and coating!  
→ If other materials are desired, please contact us.

#### 7.2.10 Additional options

<input type="checkbox"/> Attachment bearing/attachment bearing unit	For an increased radial load on the shaft journal
<input type="checkbox"/> Double pump	Two pump stages (size R25/R35/R45)
<input type="checkbox"/> Noise optimisation	For flow media with increased air content

→ Please select additional, desired optional versions! For further information and/or the coordination of design details, please contact us.

## 7.3 Pump design

If you require a technical design from us or if you are planning for operation outside the limits specified in the following chapter, please send us the following data:

Desired flow rate (min.):	I/min
Speed:	
– Constant	rpm
– min./max.	rpm
Inlet pressure (manometric)	
– Constant	bar
– min./max.	bar
Outlet pressure (manometric)	
– Constant	bar
– min./max.	bar
Environmental temperature:	
– Constant	°C
– min./max.	°C
Flow media temperature:	
– Constant	°C
– min./max.	°C
Kinematic viscosity:	
– Constant	mm <sup>2</sup> /s
– min./max.	mm <sup>2</sup> /s
Flow medium:	

**Further information on pump design:**

## 8 Technical data

The technical data in this catalogue are intended for general information. During installation, operation and maintenance, the operating instructions and the information specified on the products must be observed.

### 8.1 Operational limits

The maximum permissible operating conditions for gear pumps in the standard version are described in the following. Contact RICKMEIER whenever it is necessary to exceed these specifications. In such cases, please contact our [Sales department](#).

As a prerequisite for a long service life and maximum operational safety, the flow medium must retain its lubricity and, if possible, be clean and non-corrosive, but in any case must always be free of hard admixtures.

Consideration must be given also to the following:

Properties		Min.	Max.
Flow medium	Kinematic viscosity	5 mm <sup>2</sup> /s <sup>1)</sup>	20000 mm <sup>2</sup> /s <sup>1)</sup>
	Degree of contamination (according to ISO 4406:1999, max.)		21/19/17
	Gas content (undissolved, max.)		10 vol. % <sup>2)</sup>
	Temperature (NBR seals)	-25 °C	80 °C
	Temperature (FKM seals)	-25 °C	150°C <sup>3)</sup>
Inlet pressure (constant pressure according to DIN 24312)	Radial shaft seal, standstill <sup>4)</sup>	-0.4 bar <sup>5)</sup>	5 bar
	Radial shaft seal during operation <sup>4)</sup>	-0.4 bar <sup>5)</sup>	0.5 bar <sup>6)</sup>
	Mechanical seal	-0.4 bar <sup>5)</sup>	10 bar <sup>7)</sup>
	Magnetic coupling	-0.4 bar <sup>5)</sup>	16 bar <sup>7)</sup>

Tab. 8: Operational limits of the standard design

<sup>1)</sup> Depending on the application and operating conditions, lower and/or higher viscosities are possible, please contact us.

<sup>2)</sup> Undissolved gas in the flow medium leads to increased noise emissions.

<sup>3)</sup> If used above 120°C, special measures may be required under certain circumstances (e.g., heat-resistant clutch, pressure relief valve with heat-resistant spring, etc.); with optionally available sealing materials, different temperature ranges can be implemented.

<sup>4)</sup> Manometric

<sup>5)</sup> For speeds up to 1500 rpm, up to -0.5 bar permissible; in the short term: -0.6 bar (e.g., during start-up)

<sup>6)</sup> With optionally available radial shaft seal up to 6 bar

<sup>7)</sup> Versions for higher pressures available on request

## 8.2 Operating data

### 8.2.1 Maximum approved operating data

Size	Delivery volume	Maximum approved operating data				Guide values
		Operating pressure <sup>1)</sup>	Speed	Axial force <sup>2)</sup>	Radial force <sup>3)</sup>

Tab. 9: Technical data of standard design

<sup>1)</sup> For certain operating conditions, the maximum approved operating data given in the table must not be used simultaneously. For example, avoid high operating pressures at low speed; cf. figure "Permitted pressure difference." High operating pressures in conjunction with high speed and high viscosity are also not permissible in certain combinations. Please contact us if operation of the gear pump in these limit ranges is expected.

<sup>2)</sup> Values apply with viscosity 33 mm<sup>2</sup>/s and speed 1450 rpm, "clockwise" axial force direction in the "clockwise" direction of rotation in the direction of the drive, in the "anti-clockwise" direction of rotation in the direction of the gear pump (right-hand drive pinion).

<sup>3)</sup> Values apply with viscosity 33 mm<sup>2</sup>/s, higher radial forces on version with attachment bearing available on request.

<sup>4)</sup> The specified sound pressure level values apply to cavitation-free operation of the gear pump on the test stand at speed 1450 rpm, outlet pressure 5 bar and with air-free flow medium (distance to the gear pump: 1 m).

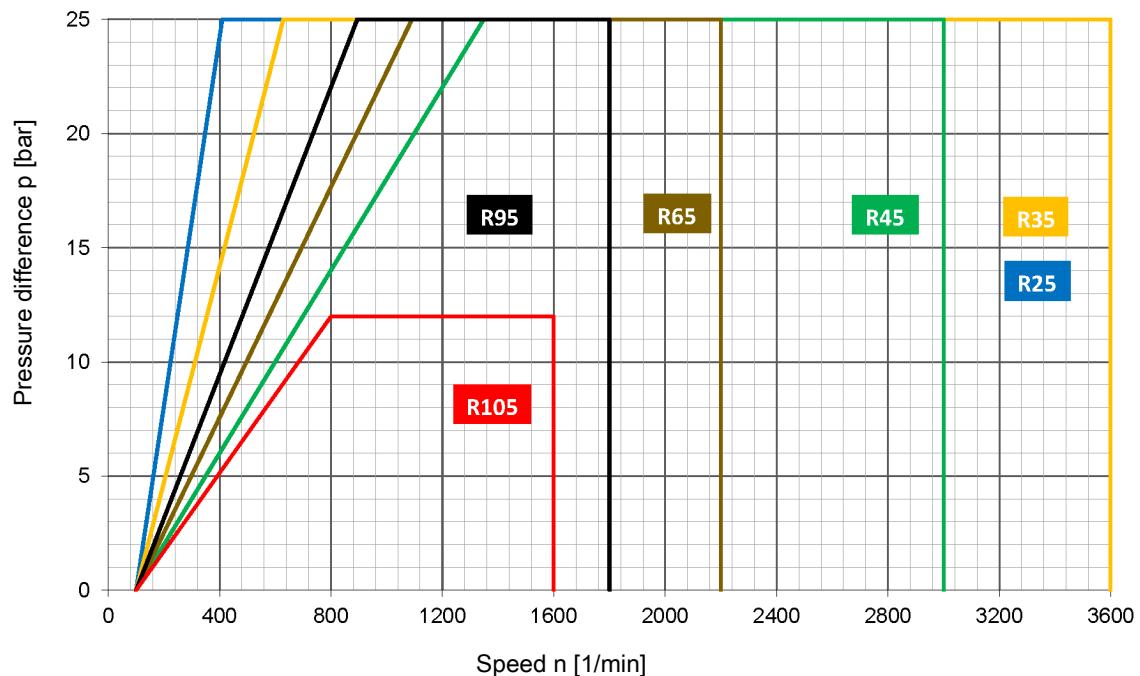

Fig. 9: Permissible pressure difference (viscosity = 33 mm<sup>2</sup>/s)

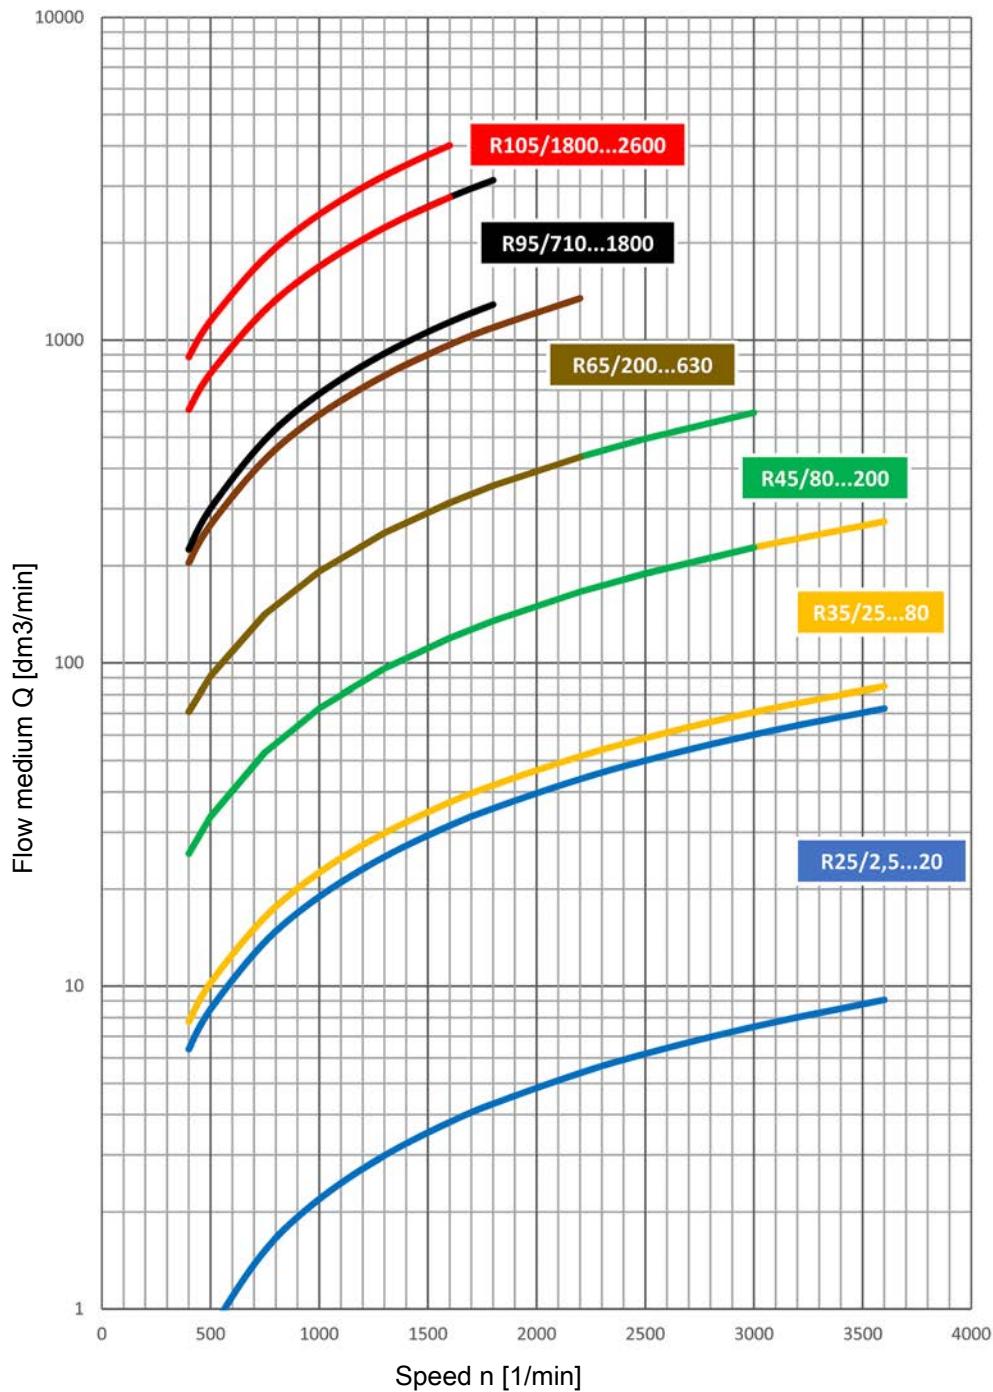

Fig. 10: Flow rate versus speed (values apply for kinematic viscosity = 33 mm<sup>2</sup>/s and outlet pressure p<sub>2</sub> = 5 bar)

### 8.2.2 Flow medium and drive power

- The values shown in the following table are guide values and apply for a mineral oil with a viscosity of 33 mm<sup>2</sup>/s and a density of 860 kg/m<sup>3</sup>.
- Please contact us for help in calculating delivery volume and power requirement in the case of deviating operating conditions.
- At a lower viscosity, a decrease in the flow medium is to be expected.
- At a higher viscosity, the power requirement P increases.
- An electric motor with a drive power 10% higher than the power requirement indicated or calculated must be selected.

### 8.2.2.1 Speed n = 950 rpm

2600					

Tab. 16: Dimensional sheet of size R105

## 10 Dimensional sheets of pump units

Pump units are equipped as standard with three-phase asynchronous motors of efficiency class IE3. Single-phase AC motors and DC motors of various voltage levels are also available on request.

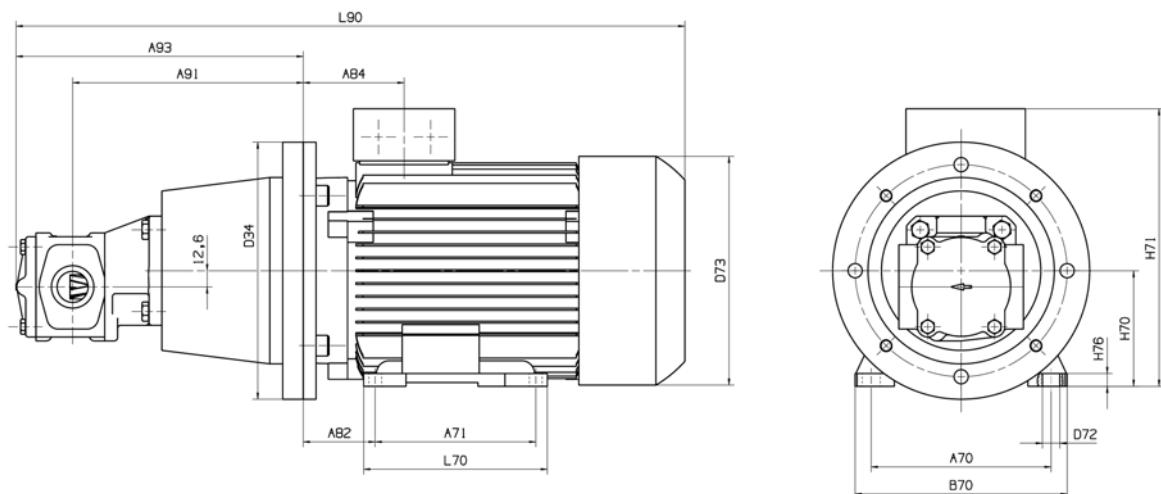

The motor dimensions specified in the dimension tables, which are not standardised in EN 50347, refer to our standard make (special manufacturers are available on request). The dimensions of the standard pump units for different motor sizes can be found in the tables on the following pages.

For different versions (e.g., other motor designs, V1 design, gear pumps with pressure relief valve and/or mechanical seal or magnetic coupling), we will gladly inform you about the respective dimensions and weights on request.

For railway, ship or other applications with special vibration loads, we recommend the heavy-duty design for the unit foot. This changes the drilling pattern of the foot attachment; dimensions on request.
